

A photograph of a desk setup with three monitors. The left monitor shows a city street at night with a crane. The middle monitor shows a city skyline with many windows lit up. The right monitor shows a city skyline with a large bridge. A keyboard and a mouse are on the desk in front of the monitors. The background is a warm, orange glow.

AGENT FLEET · FIELD NOTES

Agents that work while you sleep

I have been running that for months.
On a Raspberry Pi. On my desk.

A photograph of a cluttered electronics workbench. In the background, a computer monitor displays a blue screen. To the right, a blue component tray holds various electronic parts, with labels for 'PIC10', 'PIC12', 'PIC16', 'Buttons', 'Switches', 'Crystals', and 'Knobs'. Three pairs of pliers with red handles are hanging on the wall. A black carrying case for a handheld device lies on a piece of paper with handwritten notes. In the foreground, a white Tektronix oscilloscope is on the left, and a yellow digital multimeter is on the right. A soldering iron is also visible. The workbench is covered with various cables, a keyboard, and other electronic components.

THE PROMISE IS REAL

My fleet runs jobs at 3am

It transcribes, it scans, it files things.
It does that whether I am awake or not.

THE PART NOBODY DEMOS

Then something broke at 3am

One agent filtered messages by its own name.
Nothing matched. It went quiet for **nine hours**.

THE FAILURE MODE

Silence and success are the same signal

An agent that has stopped working looks identical to
an agent with nothing to do.

WHAT I CHANGED

Three rules for unattended agents

- Every job reports that it ran, not just that it finished
- Silence is treated as failure, not as success
- Nothing writes without a heartbeat I can check

A close-up photograph of a Raspberry Pi 4 computer. The device is black with a silver heat sink and a black cooling fan. A red USB-C cable is plugged into the top. It is connected to a black TP-Link network switch via a yellow Ethernet cable. The switch has several ports with green indicator lights. The background is dark and out of focus.

THE SHORT VERSION

Autonomy is easy to launch. Supervision is the product.

The tools are now good enough that this matters more than the model does.
